Bandwidth Controller

Tools → Bandwidth Controller raises or lowers the speed of all packages by a percentage, without editing each profile. For example, a holiday speed boost (150%) or throttling during congestion (75%).

- Each normal profile has a slider from **25%** to **200%**, and shows the resulting download / upload speed.
- The **All Profiles** slider sets every profile to the same value.
- Click **Save** to apply. **Reset** returns all sliders to 100% (click Save after it).

The speeds in the profiles themselves are not changed; set the sliders back to 100% to return to normal. Users who are online may need to reconnect to get the new speed. Expired and FUP profiles are not listed.

Required permission: Tools -> Bandwidth Control (system administrators)
