RADIUS Log

Log → RADIUS Log ("FreeRADIUS Log") shows the RADIUS server log **live**: new lines appear as they are written. It is used for troubleshooting together with Snono support.

- Only new lines from the moment you open the page are shown (no history).
- Use the **clear** icon to empty the view.
- Typical lines: login rejects with a reason (the same codes as in the User Auth Log and Login Errors), *Timeout waiting for child* or *Ignoring duplicate packet* (the server is overloaded or routers resend requests).

> The page needs the **Radius Log Monitor** service (*Tools → System Services*). If you open the panel through a custom domain, the domain's web configuration must include the RADIUS log path. If the page stays empty, contact Snono support.

Required permission: Reports - Radius Log
